

SpadeBloom

PRODUCTION CONTROL

See who's building what — and inspect it in 3D.

Real-time production control, 3D/AR quality, and live labor visibility for metal-fabrication shops.

3D / AR QA

inspect vs. the model

THE PROBLEM

Most fab shops run the floor half-blind

Paper travelers and spreadsheets work for six jobs. At sixty, they break — and you can't see the floor, the labor, or the quality in time to act.

Stale, end-of-shift visibility

Supervisors walk the floor to find status; planners act on data 12+ hours old.

Labor that never gets captured

Hand-written times are slow and skipped — so the dashboard becomes fiction.

Clipboard QA that misses the part

2D checklists can't verify a built assembly against intent; rework is caught late.

THE COST OF NOT KNOWING

40–60%

typical OEE at SMB shops

20–40%

of scheduled time spent non-productive

12 hrs

how stale paper/spreadsheet data can be

THE SOLUTION

One platform — from work order to weld inspection

SpadeBloom is the fast-to-deploy execution-and-quality layer between paper and a heavyweight ERP. Three hooks lead the story:

See your floor live

Who's on which order and stage, against target — right now, on web and phone.

QA in 3D & AR

Inspect assemblies against the 3D model; pin defects to the geometry, in AR.

Labor that tracks itself

Per-operator, per-stage time — no paper travelers, no end-of-shift guesswork.

Live in weeks — three simple steps

Model your routings

Define each product's stages and target times once. Versioned, drag-to-reorder.

Operators run & inspect

Click into each stage on the phone or web; view the 3D model and flag defects in AR.

See it all, live

Real-time dashboard, Live Stage Status, QA results and labor reports — no refresh.

Your whole floor, live

- Live Stage Status: operator, order, stage, elapsed and station — updating with no refresh.
- KPI cards for work orders, active operators, output and labor efficiency.
- Works the same on the web portal and the operator's phone.

Web + mobile, one live source

Labor time that tracks itself

- Operators clock into a specific stage of a specific work order — one tap.
- Idle, break and rework are captured, not guessed.
- Supervisors review and correct entries; compare actual vs. target by stage.
- Accurate labor data finally makes job costing and quoting possible.

The standout capability

Actual vs. target — by stage

Target **Actual**

Cut

Form

Weld

Assemble

Inspect

Weld and form stages running over target — visible the moment it happens, not at month-end.

Quality, in 3D and AR

What sets us apart

Assembly viewer

AR mode

- Defect — weld porosity (sev. high)
- Out-of-tolerance — gap 2.1mm > 1.5mm
- Pass — signed off

Inspect against the real model

Compare the built assembly to the actual 3D geometry — not a 2D checklist.

Defects pinned to the geometry

Capture type, severity, measurements and tolerances right on the part.

AR-assisted on the floor

Operators view and check assemblies in AR, where the work happens.

Sign-offs & defect patterns

Approvals and recurring-defect views build a real quality record.

Deeper scan-to-model comparison is in active development.

A real tool in the operator's hand

If reporting feels like paperwork, it won't happen. So the operator app makes it one tap — and works in the dead zones of the floor.

Assigned work

Each operator sees exactly their jobs and stages.

One-tap clock in / out

Per stage, with idle, break and rework.

3D / AR reference

View the model and inspect the assembly on-device.

Offline queue

Keeps working with no signal; syncs when back.

Orders move the way the floor moves

Full lifecycle: draft → pending → in-progress → completed, with priorities, due dates, line assignment, order dependencies, batch operations and a kanban board.

The obvious next step from paper

	Real-time labor	3D / AR QA	Fast to deploy	Operator-first
Heavy ERP / MES	—	Logs only	—	—
Machine monitors	Partial	—	Partial	—
DIY platforms	Partial	—	—	Partial
Paper & spreadsheets	—	—	Yes	Partial
SpadeBloom	Yes	Yes	Yes	Yes

***Your sharpest edge:** 3D/AR quality — heavy ERPs only log inspections as flat data; machine monitors and paper don't do it at all.*

Built for metal-fab shops

Who it's for

- Metal fabrication & sheet-metal job shops — welding, CNC, press-brake, assembly.
- ~20–300 employees / 1–6 production lines.
- Multi-stage routed jobs where QA against a model matters.
- Big enough that paper breaks down — too lean for a heavyweight ERP.

Three clients, one API

Angular web portal

Managers, supervisors, planners

React Native operator app

On the floor, iOS & Android

REST + real-time API

WebSocket live updates, documented

Cloud-deployed

Standard cloud infra, role-based access + audit log

Honest today, ambitious next

We lead with what's live and ship the rest in sequence — starting from the labor and quality data SpadeBloom already captures.

NOW · LIVE

- Live floor visibility
- Per-stage labor tracking
- 3D/AR quality inspection
- Work orders & kanban
- Operator mobile app

NEXT

- Deeper scan-to-model AR QA
- Materials & BOM
- Shortage check before release
- Equipment & downtime

LATER

- Finite scheduling & capacity
- Labor + material costing
- Lot / serial traceability
- True OEE

See your floor live.

Real-time production control, 3D/AR quality, and labor that tracks itself — running in weeks, not quarters.
