

See who's building what — and inspect it in 3D.

Production control, 3D/AR quality & live labor visibility for the modern fab floor

SpadeBloom shows who is building which order and stage in real time — and lets operators inspect assemblies against the 3D model. It goes live in weeks, not the quarters a heavyweight ERP takes.

WHAT IT DOES

See your floor live

Live Stage Status + KPIs: operator, order, stage and elapsed — no refresh.

QA in 3D & AR

FLAGSHIP

Inspect assemblies vs. the model; pin defects to the geometry, in AR.

Labor that tracks itself

Per-stage clock in/out; idle, break and rework, all captured.

Operator mobile app

Assigned work, one-tap clock in/out, 3D/AR reference, offline.

Work orders & kanban

Draft to done, with priorities, dependencies and batch ops.

Process templates

Versioned routings — build each product the same way every time.

WHO IT'S FOR

- Metal fabrication & sheet-metal job shops — weld, CNC, press-brake, assembly.
- ~20–300 employees / 1–6 production lines.
- Multi-stage routed jobs where QA against a model matters.
- Big enough that paper breaks down — too lean for a full ERP.

WHY SPADEBLOOM

- **Faster than an ERP.**
Live in weeks; operators actually adopt it.
- **More than machine data.**
Tracks people, work and part quality.
- **Beats paper for good.**
Real-time vs. 12-hour-old data; consistent capture.
- **3D/AR QA is the edge.**
ERPs only log inspections; monitors and paper can't.

40–60%

typical OEE at SMB shops

20–40%

time lost to non-productive work

Live

status, no end-of-shift wait
